CONTENTS

CHAPTER 1 **01-45**

BASIC DEFINITIONS, TYPES OF LEARNING, HYPOTHESIS SPACE AND INDUCTIVE BIAS, EVALUATION, CROSS-VALIDATION, LINEAR REGRESSION, DECISION TREES, OVER FITTING, INSTANCE-BASED LEARNING, FEATURE REDUCTION, COLLABORATIVE FILTERING-BASED RECOMMENDATION.

1.1 Introduction to Machine Learning and Basic Definitions
1.2 Types of Machine Learning: Supervised, Unsupervised and Reinforcement Learning
1.3 Hypothesis Space and Concept Representation
1.4 Inductive Bias and Generalization in Machine Learning
1.5 Model Evaluation Metrics and Performance Assessment
1.6 Training, Validation and Test Datasets
1.7 Cross-Validation Techniques and Model Selection
1.8 Linear Regression: Simple and Multiple Linear Regression
1.9 Decision Trees: Construction, Splitting Criteria and Pruning
1.10 Overfitting, Underfitting and Bias–Variance Trade-Off
1.11 Instance-Based Learning: K-Nearest Neighbours
1.12 Feature Reduction: Feature Selection and Dimensionality Reduction
1.13 Collaborative Filtering-Based Recommendation Systems

CHAPTER 2 **46-90**

PROBABILITY AND BAYES LEARNING, LOGISTIC REGRESSION, SUPPORT VECTOR MACHINE, KERNEL FUNCTION AND KERNEL SVM.

2.1 Probability Theory and Fundamentals of Probabilistic Learning
2.2 Conditional Probability, Joint Probability and Bayes' Theorem
2.3 Bayesian Learning and Maximum A Posteriori Estimation
2.4 Naive Bayes Classifier: Assumptions, Types and Applications
2.5 Logistic Regression: Model Formulation and Sigmoid Function
2.6 Binary and Multiclass Logistic Regression
2.7 Parameter Estimation, Loss Functions and Regularization in Logistic Regression
2.8 Support Vector Machine: Concepts and Maximum-Margin Classification
2.9 Linear SVM, Hard-Margin and Soft-Margin Classification
2.10 Kernel Functions: Linear, Polynomial, Gaussian and Sigmoid Kernels
2.11 Kernel Trick and Nonlinear Classification
2.12 Kernel SVM: Model Training, Hyperparameter Selection and Applications

CHAPTER 3 **91-117**

PERCEPTRON, MULTILAYER NETWORK, BACK PROPAGATION, INTRODUCTION TO DEEP NEURAL NETWORK.

3.1 Fundamentals of Artificial Neural Networks
3.2 Biological Neurons and Computational Models of Artificial Neurons
3.3 Perceptron Model: Architecture, Learning Rule and Limitations
3.4 Single-Layer Perceptron and Linear Separability
3.5 Multilayer Neural Networks: Architecture and Information Flow
3.6 Activation Functions: Sigmoid, Tanh, ReLU and Softmax
3.7 Forward Propagation and Network Output Computation
3.8 Backpropagation Algorithm and Error Propagation
3.9 Gradient Descent and Weight Update Mechanisms
3.10 Loss Functions, Learning Rate and Neural Network Optimization
3.11 Introduction to Deep Neural Networks and Deep Learning
3.12 Deep Network Architectures, Training Challenges and Applications

CHAPTER 4 **118-150**

COMPUTATIONAL LEARNING THEORY, PAC LEARNING MODEL, SAMPLE COMPLEXITY, VC DIMENSION, ENSEMBLE LEARNING.

4.1 Fundamentals of Computational Learning Theory
4.2 Learnability, Generalization and Error Bounds
4.3 Probably Approximately Correct (PAC) Learning Framework
4.4 PAC-Learnability: Realizable and Agnostic Learning Models
4.5 Sample Complexity and Training Data Requirements
4.6 Empirical Risk Minimization and Generalization Guarantees
4.7 Vapnik–Chervonenkis (VC) Dimension: Concepts and Definitions
4.8 VC Dimension of Hypothesis Classes and Capacity Estimation
4.9 Relationship Between VC Dimension, Sample Complexity and Generalization
4.10 Introduction to Ensemble Learning and Model Combination
4.11 Bagging, Bootstrap Sampling and Random Forests
4.12 Boosting Algorithms: AdaBoost and Gradient Boosting
Voting, Stacking and Performance Evaluation of Ensemble Models

CHAPTER 5 **151-198**

CLUSTERING: K-MEANS, ADAPTIVE HIERARCHICAL CLUSTERING, GAUSSIAN MIXTURE MODEL.

5.1 Introduction to Unsupervised Learning and Clustering
5.2 Clustering Objectives, Similarity Measures and Distance Metrics
5.3 Data Preprocessing and Feature Scaling for Clustering
5.4 K-Means Clustering: Algorithm, Initialization and Convergence
5.5 Selection of Optimal Number of Clusters: Elbow Method and Silhouette Score

5.6 K-Means Limitations, Variants and Practical Applications
5.7 Hierarchical Clustering: Agglomerative and Divisive Approaches
5.8 Adaptive Hierarchical Clustering: Concepts and Cluster Formation
5.9 Linkage Criteria, Dendrograms and Cluster Selection
5.10 Gaussian Mixture Models: Probability Distributions and Model Formulation
5.11 Expectation-Maximization (EM) Algorithm for Gaussian Mixture Models
5.12 Hard Clustering and Soft Clustering: Comparative Analysis
5.13 Clustering Evaluation Metrics and Real-World Applications
5.14 Introduction to Ensemble Learning and Model Combination
5.15 Bagging and Random Forests
5.16 Boosting: AdaBoost, Gradient Boosting and XGBoost
5.17 Stacking, Blending and Voting Ensembles
