TABLE OF CONTENT

CHAPTER 1 **01-23**

FUNDAMENTALS OF SOIL AND WATER QUALITY ASSESSMENT

1.1 Introduction to Environmental Quality

1.1.1 Meaning and scope of soil quality

1.1.2 Soil health and ecosystem sustainability

1.1.3 Relationship between soil, water and plant systems

1.2 Soil Quality Indicators

1.2.1 Physical indicators: texture, structure, bulk density and porosity

1.2.2 Chemical indicators: pH, electrical conductivity and nutrient status

1.2.3 Biological indicators: microbial activity and soil biodiversity

1.3 Water Quality Parameters

1.3.1 pH, turbidity and electrical conductivity

1.3.2 Dissolved oxygen, biochemical oxygen demand and chemical oxygen demand

1.3.3 Nutrients, pathogens and selected contaminants

1.4 Soil–Water Interactions

1.4.1 Infiltration, percolation and water retention

1.4.2 Salinity, sodicity and nutrient transport

1.4.3 Land use and climate influences on quality

1.5 Environmental Standards and Indices

1.5.1 Soil and water quality indices

1.5.2 Environmental monitoring standards and guidelines

1.5.3 Sustainability indicators and assessment frameworks

1.6 Fundamentals of Soil and Water Quality Monitoring

1.6.1 Objectives and importance of soil and water quality monitoring

1.6.2 Soil and water sampling techniques and procedures

1.6.3 Laboratory analysis and field-based measurement methods

CHAPTER 2 **24-43**

SOIL AND WATER SAMPLING, TESTING AND DATA ACQUISITION

2.1 Environmental Sampling Design

2.1.1 Objectives and selection of sampling locations

2.1.2 Grab, composite and depth-wise soil sampling

2.1.3 Seasonal sampling and sample preservation

2.2 Soil Testing Methods

2.2.1 Soil pH and electrical conductivity measurement

2.2.2 Nutrient, organic carbon and salinity analysis

2.2.3 Contaminant and heavy-metal testing

2.3 Water Sampling and Laboratory Analysis

2.3.1 Groundwater, surface water and wastewater sampling

2.3.2 Sample containers, preservation and transport

2.3.3 Laboratory methods for physical and chemical parameters

2.4 Quality Assurance and Quality Control
2.4.1 Sensor calibration and reference measurements
2.4.2 Replicates, blanks, standards and measurement uncertainty
2.4.3 Data validation and traceability
2.5 Environmental Data Preparation
2.5.1 Data formats, metadata and units
2.5.2 Missing values, outliers and noise treatment
2.5.3 Dataset integration and documentation
2.6 Introduction to Environmental Data Acquisition
2.6.1 Sensor-Based Data Collection and Monitoring Systems
2.6.2 Real-Time Data Acquisition and Transmission
2.6.3 Data Storage, Management and Monitoring Dashboards

CHAPTER 3 **44-70**
SENSOR NETWORKS AND IOT FOR ENVIRONMENTAL MONITORING
3.1 Sensors for Soil Monitoring
3.1.1 Soil moisture and temperature sensors
3.1.2 pH and electrical conductivity sensors
3.1.3 Nutrient and contaminant sensing approaches
3.2 Sensors for Water Quality
3.2.1 Turbidity and optical sensors
3.2.2 Dissolved oxygen and conductivity sensors
3.2.3 Sensor selection, range and detection limits
3.3 IoT Architecture
3.3.1 Sensor nodes, gateways and cloud platforms
3.3.2 Wired and wireless communication options
3.3.3 Low-power operation and energy management
3.4 Real-Time Data Acquisition
3.4.1 Sampling intervals and data logging
3.4.2 Edge computing and local preprocessing
3.4.3 Data transmission, storage and dashboards
3.5 Reliability and Maintenance
3.5.1 Sensor drift and fouling
3.5.2 Fault detection and missing-signal handling
3.5.3 Field calibration and maintenance planning
3.6 Data Communication and Integration in Environmental Monitoring
3.6.1 Integration of Multiple Sensors and Monitoring Devices
3.6.2 Communication Protocols for Environmental Data Exchange
3.6.3 Integration of IoT Data with AI-Based Analysis Systems

CHAPTER 4 **71-98**
REMOTE SENSING AND GIS-BASED ENVIRONMENTAL ASSESSMENT
4.1 Principles of Remote Sensing
4.1.1 Satellite, airborne and UAV platforms
4.1.2 Spatial, spectral and temporal resolution
4.1.3 Optical, thermal and radar observations
4.2 Soil Quality Mapping
4.2.1 Soil reflectance and spectral features
4.2.2 Estimation of soil moisture and organic carbon
4.2.3 Salinity and degradation mapping
4.3 Water Quality Observation
4.3.1 Remote indicators of turbidity and suspended matter
4.3.2 Water-body mapping and change detection
4.3.3 Limitations of satellite-based water quality estimation
4.4 GIS and Spatial Analysis
4.4.1 Spatial databases, layers and coordinate systems
4.4.2 Interpolation and geostatistical mapping
4.4.3 Hotspot identification and risk maps
4.5 Integrating Field and Geospatial Data
4.5.1 Ground-truth data collection
4.5.2 Image preprocessing and feature extraction
4.5.3 Validation of spatial prediction maps
4.6 AI-Based Geospatial Analysis and Environmental Decision Support
4.6.1 Machine Learning for Spatial Environmental Prediction
4.6.2 GIS-Based Environmental Risk Assessment and Zoning
4.6.3 Development of Decision Support Maps for Sustainable Resource Management

CHAPTER 5 **99-124**
ARTIFICIAL INTELLIGENCE AND MACHINE LEARNING FUNDAMENTALS
5.1 Foundations of AI for Environmental Applications
5.1.1 Artificial intelligence, machine learning and deep learning
5.1.2 Environmental prediction and decision-support tasks
5.1.3 Data-driven versus process-based modelling
5.2 Learning Paradigms
5.2.1 Supervised learning
5.2.2 Unsupervised and semi-supervised learning
5.2.3 Classification, regression and clustering
5.3 Common Machine Learning Algorithms
5.3.1 Linear and nonlinear regression
5.3.2 Decision trees and Random Forest
5.3.3 Support vector machines, gradient boosting and XGBoost
5.4 Neural Networks and Ensemble Methods
5.4.1 Artificial neural network architecture

5.4.2 Model ensembles and voting strategies
5.4.3 Strengths and limitations of candidate models
5.5 Model Development Workflow
5.5.1 Feature engineering and feature selection
5.5.2 Training, validation and test datasets
5.5.3 Hyperparameter tuning and reproducibility
5.6 AI Applications in Soil and Water Quality Assessment
5.6.1 Machine Learning for Soil Quality Prediction
5.6.2 AI-Based Water Quality Monitoring and Forecasting
5.6.3 Model Deployment for Environmental Decision Support

CHAPTER 6 **125-149**
AI-DRIVEN SOIL QUALITY PREDICTION
6.1 Soil Prediction Targets and Datasets
6.1.1 Soil pH, moisture and electrical conductivity
6.1.2 Soil nutrients and fertility indicators
6.1.3 Soil organic carbon and soil health indicators
6.2 Predicting Salinity and Sodicity
6.2.1 Salinity indicators and reference measurements
6.2.2 Feature selection for salinity prediction
6.2.3 Mapping salinity risk across fields
6.3 Soil Fertility and Nutrient Estimation
6.3.1 Prediction of nitrogen, phosphorus and potassium
6.3.2 Estimating nutrient availability from soil properties
6.3.3 Model limitations across soil types
6.4 Soil Degradation and Contamination
6.4.1 Erosion and degradation indicators
6.4.2 Contaminant concentration prediction
6.4.3 Spatial risk classification
6.5 Model Implementation and Interpretation
6.5.1 Preparing soil datasets for modelling
6.5.2 Comparing regression and classification approaches
6.5.3 Translating predictions into usable soil information
6.6 AI-Based Soil Health Assessment and Decision Support
6.6.1 Integrated Soil Health Index Prediction
6.6.2 Soil Management Recommendations Based on AI Predictions
6.6.3 Precision Agriculture and Sustainable Soil Management

CHAPTER 7 **150-168**
AI-BASED WATER QUALITY PREDICTION AND CLASSIFICATION
7.1 Water Quality Indices
7.1.1 Selection and weighting of water quality parameters
7.1.2 Index calculation and interpretation
7.1.3 Limitations of aggregate indices

7.2 Predictive Modelling of Water Parameters
7.2.1 Dissolved oxygen prediction
7.2.2 BOD, COD and turbidity estimation
7.2.3 Nutrient and conductivity prediction
7.3 Contamination Detection
7.3.1 Heavy-metal and pesticide data analysis
7.3.2 Groundwater quality classification
7.3.3 Drinking-water suitability screening
7.4 Water-Body and Wastewater Monitoring
7.4.1 River and lake water quality
7.4.2 Reservoir and seasonal variation analysis
7.4.3 Industrial and municipal wastewater assessment
7.5 Decision Support and Reporting
7.5.1 Water quality classes and warning thresholds
7.5.2 Visualisation and reporting of predictions
7.5.3 Laboratory confirmation and responsible interpretation
7.6 AI-Based Water Quality Management and Forecasting
7.6.1 Forecasting Seasonal Changes in Water Quality
7.6.2 AI-Based Pollution Alerts and Early Warning Systems
7.6.3 Water Treatment and Sustainable Water Resource Management

CHAPTER 8 **169-195**
DEEP LEARNING AND PREDICTIVE ENVIRONMENTAL MODELLING
8.1 Deep Learning Foundations
8.1.1 Neural network layers, activation and loss functions
8.1.2 Optimisation and regularisation
8.1.3 Data requirements and computational considerations
8.2 Convolutional Neural Networks
8.2.1 Image preparation and augmentation
8.2.2 CNNs for satellite and UAV imagery
8.2.3 Spatial feature learning for environmental mapping
8.3 Time-Series Models
8.3.1 Environmental time-series characteristics
8.3.2 Long Short-Term Memory and Gated Recurrent Unit networks
8.3.3 Forecast horizons and sequence preparation
8.4 Transformer-Based Modelling
8.4.1 Attention mechanisms and transformer architecture
8.4.2 Multivariate environmental forecasting
8.4.3 Data volume, interpretability and computational cost
8.5 Hybrid and Process-Informed Models
8.5.1 Combining physical models and machine learning
8.5.2 Incorporating domain constraints
8.5.3 Comparing hybrid and data-driven approaches

8.6 Advanced Deep Learning Applications in Environmental Prediction
8.6.1 Deep Learning for Spatiotemporal Soil and Water Quality Prediction
8.6.2 Multimodal Learning Using Sensor, Satellite and Weather Data
8.6.3 Scalable Deployment of Deep Learning Models for Environmental Monitoring

CHAPTER 9 **196-224**
INTEGRATED SOIL–WATER MODELLING AND SMART RESOURCE MANAGEMENT
9.1 Coupled Soil–Water Systems
9.1.1 Soil moisture, infiltration and groundwater interactions
9.1.2 Transport of nutrients and contaminants
9.1.3 Linking soil and water quality observations
9.2 Smart Irrigation and Water Use
9.2.1 Irrigation scheduling from soil moisture predictions
9.2.2 Water-use efficiency and resource allocation
9.2.3 Decision rules and operational constraints
9.3 Nutrient Leaching and Agricultural Runoff
9.3.1 Drivers of nutrient transport
9.3.2 Runoff prediction and pollution risk
9.3.3 Mitigation planning for agricultural catchments
9.4 Watershed and Hydrological Integration
9.4.1 Rainfall, flow and catchment characteristics
9.4.2 Integrating hydrological and quality datasets
9.4.3 Spatial and temporal watershed assessment
9.5 Decision-Support Systems
9.5.1 System architecture and user requirements
9.5.2 Alerts, recommendations and visual dashboards
9.5.3 Evaluation of management outcomes
9.6 AI-Driven Sustainable Soil and Water Resource Management
9.6.1 AI-Based Resource Optimisation and Allocation
9.6.2 Integrated Strategies for Soil Conservation and Water Quality Protection
9.6.3 Smart Agriculture and Sustainable Environmental Planning

CHAPTER 10 **225-252**
EXPLAINABLE AI, UNCERTAINTY AND MODEL VALIDATION
10.1 Model Validation Strategy
10.1.1 Train–validation–test partitioning
10.1.2 Cross-validation and independent datasets
10.1.3 Temporal and spatial leakage prevention
10.2 Performance Metrics
10.2.1 MAE, RMSE and coefficient of determination
10.2.2 Accuracy, precision, recall and F1-score
10.2.3 Metric selection for environmental decisions

10.3 Explainable AI
10.3.1 Global and local explanations
10.3.2 Feature importance and permutation analysis
10.3.3 SHAP and partial dependence
10.4 Uncertainty Quantification
10.4.1 Measurement and model uncertainty
10.4.2 Prediction intervals and calibration
10.4.3 Communicating confidence to end users
10.5 Robustness, Bias and Transferability
10.5.1 Performance across regions and seasons
10.5.2 Dataset shift and missing data
10.5.3 Fairness, robustness and model monitoring
10.6 Trustworthy AI for Environmental Decision-Making
10.6.1 Interpreting AI Predictions for Environmental Applications
10.6.2 Risk-Based Decision-Making and Uncertainty-Aware Recommendations
10.6.3 Ethical AI, Transparency and Responsible Model Deployment

CHAPTER 11 **253-280**
ENVIRONMENTAL POLLUTION PREDICTION AND SUSTAINABLE REMEDIATION
11.1 Environmental Risk Mapping
11.1.1 Soil and groundwater pollution pathways
11.1.2 Spatial risk indicators and exposure
11.1.3 Prioritising sites for investigation
11.2 Agricultural and Industrial Pollution
11.2.1 Agricultural runoff and nutrient pollution
11.2.2 Industrial effluent and wastewater impacts
11.2.3 Pesticides, metals and emerging contaminants
11.3 AI for Remediation Planning
11.3.1 Screening and selecting remediation options
11.3.2 Monitoring remediation performance
11.3.3 Resource and cost considerations
11.4 Environmental Risk and Climate Resilience
11.4.1 Drought, flooding and salinity risks
11.4.2 Climate-sensitive soil and water assessment
11.4.3 Scenario analysis and adaptation planning
11.5 Governance and Responsible Use
11.5.1 Environmental regulations and reporting
11.5.2 Data transparency and stakeholder participation
11.5.3 Limits of predictive tools in regulatory decisions
11.6 AI-Enabled Pollution Control and Sustainable Environmental Recovery
11.6.1 AI-Based Pollution Prevention and Control Strategies
11.6.2 Sustainable Remediation Techniques and Recovery Ass essment
11.6.3 Long-Term Environmental Monitoring and Ecosystem Restoration

CHAPTER 12 **281-309**
EMERGING TRENDS, CASE STUDIES AND FUTURE DIRECTIONS
12.1 Edge AI and Federated Learning
12.1.1 On-device inference for sensor networks
12.1.2 Federated learning across monitoring locations
12.1.3 Connectivity, privacy and resource constraints
12.2 Physics-Informed AI
12.2.1 Physical constraints in environmental models
12.2.2 Hybrid learning for soil and water systems
12.2.3 Benefits and limitations of physics-informed approaches
12.3 Digital Twins for Environmental Systems
12.3.1 Digital twin concepts and architecture
12.3.2 Sensor-data assimilation and model updating
12.3.3 Applications to farms, watersheds and water utilities
12.4 Open Data and Research Reproducibility
12.4.1 Open environmental datasets and metadata
12.4.2 Code sharing, versioning and reproducible workflows
12.4.3 Data governance, privacy and ethical AI
12.5 Case Studies and Research Opportunities
12.5.1 Case study: soil quality prediction
12.5.2 Case study: water quality forecasting
12.5.3 Research gaps, deployment challenges and future directions
12.6 Future Perspectives on AI-Driven Environmental Sustainability
12.6.1 Emerging Technologies for Intelligent Environmental Monitoring
12.6.2 Scalable AI Solutions for Sustainable Soil and Water Management
12.6.3 Future Research Directions and Global Environmental Challenges
